**(SANBAG)**

**November 2013**

## **Preface to the SANBAG Development Mitigation Nexus Study**

The SANBAG Development Mitigation Nexus Study was originally approved by the San Bernardino Associated Governments (SANBAG), acting as the San Bernardino County Congestion Management Agency (CMA), on October 5, 2005. It has been revised based on amendments approved by the SANBAG Board on July 5, 2006, October 4, 2006, November 1, 2006, January 10, 2007, March 7, 2007, November 7, 2007, November 4, 2009, and November 2, 2011. The Nexus Study has been incorporated into the SANBAG Congestion Management Program (CMP) as Appendix K. SANBAG serves as the Congestion Management Agency responsible for implementing and maintaining the CMP. This update includes a complete revision of project cost estimates, superseding prior updates that generally involved the use of escalation factors. This document serves as the final version for the 2013 update to the Nexus Study, which is required by the Development Mitigation Program implementation language included in Appendix J of the CMP and the Measure I 2010-2040 Strategic Plan. This update reflects comments from members of the Transportation Technical Advisory Committee (TTAC), was reviewed by the SANBAG General Policy Committee on October 9, 2013, and was approved by the SANBAG Board of Directors on November 6, 2013.

## **Background**

SANBAG staff began preparation of the Nexus Study in early 2004 at the direction of the SANBAG Board of Directors to support the development of Measure I 2010-2040. Measure I 2010-2040 was overwhelmingly approved by the voters of San Bernardino County on November 2, 2004. Included in the Measure I 2010-2040 Ordinance was language mandating development to pay its fair share for transportation improvements within San Bernardino County. The specific language governing the development contribution requirements of Measure I 2010-2040 are included in Section VIII of the ordinance as follows:

*“SECTION VIII. CONTRIBUTIONS FROM NEW DEVELOPMENT. No revenue generated from the tax shall be used to replace the fair share contributions required from new development. Each local jurisdiction identified in the Development Mitigation Program must adopt a development financing mechanism within 24 months of voter approval of the Measure ‘I’ that would:*

*“1) Require all future development to pay its fair share for needed transportation facilities as a result of the development, pursuant to California Government Code 66000 et seq. and as determined by the Congestion Management Agency.*

*“2) Comply with the Land Use/Transportation Analysis and Deficiency Plan provisions of the Congestion Management Program pursuant to California Government Code Section 65089.*

*“The Congestion Management Agency shall require fair share mitigation for regional transportation facilities through a Congestion Management Program update to be approved within 12 months of voter approval of Measure ‘I.’”*

The SANBAG Development Mitigation Program is collectively comprised of three documents—Chapter 4 (“Land Use/Transportation Analysis Program”), Appendix K and Appendix J of the CMP. The Development Mitigation Program was originally approved by the CMA on November 2, 2005, along with other revisions to the CMP. Appendix J of the CMP provides the specific requirements local jurisdictions must follow when implementing their development mitigation program for regional transportation facilities.

The San Bernardino County CMP implements the Land Use/Transportation Analysis Program with two distinct approaches, depending on geographic location within the County. The first approach addresses the cities and associated spheres of influence in the San Bernardino Valley and Victor Valley, to which the Nexus Study and related development mitigation requirements apply. The second approach applies to all other areas of the County. These two approaches are summarized below:

1. For San Bernardino Valley and Victor Valley cities and sphere areas: local jurisdictions implement development mitigation programs that generate development contributions for regional transportation improvements equal to or greater than fair share contributions determined through the SANBAG Development Mitigation Nexus Study. Regional transportation facilities addressed by the Nexus Study include freeway interchanges, railroad grade separations, and regional arterial highways on the Nexus Study Network. Local jurisdiction development mitigation programs must comply with requirements established in Appendix J of the CMP. Each local jurisdiction has adopted a compliant development mitigation program based on the requirements established in this appendix and implemented in accordance with Chapter 4 and Appendix J of the CMP.
2. For areas outside the San Bernardino Valley and Victor Valley cities and spheres: local jurisdictions must prepare Traffic Impact Analysis (TIA) reports for proposed development projects exceeding specified thresholds of trip generation. This is a continuation of a requirement established when the CMP was originally approved by the SANBAG Board in 1992. TIA reports must comply with requirements contained in Chapter 4 and Appendix C of the CMP.

At their discretion, jurisdictions outside the Valley and Victor Valley may adopt Approach 1, in coordination with and subject to the approval of the SANBAG Board. However, an amendment to the Nexus Study would be required for this to occur.

## **Overview of the Nexus Study**

The SANBAG Nexus Study identifies the fair share contributions from new development for regional transportation improvements (freeway interchanges, railroad grade separations, and

**SANBAG Development Mitigation Nexus Study**  
**November 2013**  
**Page 3 of 24**

regional arterial highways). The Nexus Study is updated biennially or as requested and in close coordination with local jurisdictions.

The Nexus Study identifies a Nexus Study Network, representing regional roadways in the urbanized areas of San Bernardino County. Roadway improvement projects must be located on this network for their costs to be included in the Nexus Study and to be eligible to receive or expend Measure I 2010-2040 Valley Freeway Interchange, Valley Major Street, Victor Valley Local Street (capacity enhancement projects only) and Victor Valley Major Local Highway funds. Additionally, projects not included in the Nexus Study are not eligible for SANBAG allocations of state or federal transportation funds included in the Measure I 2010-2040 Expenditure Plan. The Nexus Study only applies to the Victor Valley Local Street Program insofar as the jurisdiction intends to use Measure I Local Street funds to add capacity to projects on the Nexus Study Network, per Policy 40012/VVLS-8 of the Strategic Plan. A local jurisdiction may wish to identify other local or non-regional improvements (projects not on the Nexus Network) as part of its overall development mitigation program, but these local or non-regional projects are not eligible for inclusion in the Nexus Study.

The Nexus Study identifies specific improvement projects on the Nexus Study Network and includes a cost estimate for the projects. The cost estimates have been developed collaboratively, working with local jurisdictions to obtain the most up-to-date project cost data available. Costs may include planning, project development (including Project Study Reports, Project Reports, and environmental documents), design, construction, construction management, project management, right-of-way, and mitigation of impacts subject to the policy provisions contained in the Measure I Strategic Plan. Only those project phases for which costs are included in the Nexus Study are eligible for Measure I or other transportation funding allocated by SANBAG.

The Nexus Study also includes an estimate of growth in dwelling units and employment expected over the planning period of the Nexus Study (2004 to 2030). The percentage growth in trips associated with the new development is development's fair share for that geographic area. The growth estimates were prepared in collaboration with local jurisdictions, SANBAG and SCAG as part of the 2004 Regional Transportation Plan (RTP). The development mitigation fair share estimates contained in the Nexus Study represent a minimum fair share for regional transportation improvements for each local jurisdiction and for each jurisdiction's sphere area, based on the estimates of project costs and the growth data provided by those jurisdictions. San Bernardino County has provided the estimates of project costs and growth in dwelling units/employment for sphere areas and unincorporated sub-areas, such as the Redlands Donut Hole and Glen Helen/Devore. The Nexus Study calculates a fair share percentage attributable to new development for each local jurisdiction, sphere of influence, unincorporated County sub-area not contained within a sphere of influence and interchange traffic shed.

The Nexus Study does not dictate how local jurisdictions develop and implement their development mitigation programs to achieve the development contribution levels specified in this report. Local jurisdictions have substantial flexibility in their program approach. In addition, the SANBAG Nexus Study does not dictate per-unit contribution levels

(or development fees) by land use type. Each jurisdiction must develop its own schedule of fees or other per-unit mitigation levels that can be demonstrated to achieve the development contribution levels specified in this Nexus Study by facility type. Appendix J of the CMP also indicates that cities and the County may make arrangements to combine the required development contribution levels for each jurisdiction and its sphere and to develop a unified development mitigation program for the city and the sphere. For example, if a city is using a development impact fee (DIF) program to meet the SANBAG requirements, a common fee structure for the city and sphere could be established. The city and County would need to establish the appropriate legal agreements and administrative processes to manage such a joint program. The information in the SANBAG Nexus Study allows for either separate or joint city/County programs. If a joint program is pursued, the city and County would add the development contribution levels for the both the city and sphere area.

The methodology employed by the Nexus Study for calculating fair share development contributions was developed in early 2004 by the Nexus Study Task Force, consisting of staff representatives from local jurisdictions and from the private sector (principally the Building Industry Association and the National Association of Industrial and Office Properties). Individual meetings were also held with local jurisdictions and private entities, including representatives of the retail development industry. The implementation requirements contained in Chapter 4 and Appendix J of the CMP were developed in early 2005 by a working group of representatives from both local jurisdictions and the private sector. Chapter 4 and Appendix J were also reviewed by the SANBAG Comprehensive Transportation Plan Technical Advisory Committee (CTP TAC) prior to policy review and adoption by the SANBAG Board of Directors.

### **The Regional Transportation System**

A “Nexus Study Network” has been defined as a basis for establishing the arterial roadways to be included in the Nexus Study. This network is regional in nature, but should not be confused with other systems, such as the existing Measure I Regional Arterial System in the Victor Valley. The system has been based on a generalized set of criteria involving roadway functional classification, propensity to carry inter-jurisdictional traffic, connection to the freeway system, etc. For example, every roadway that interchanges with a freeway is included on the Nexus Study Network. Figures 1 and 2 show the Nexus Study Network in the Valley and Victor Valley, respectively.

A list of interchanges has been compiled for inclusion in the Nexus Study. The list was originally based on the interchanges submitted by SANBAG and local jurisdictions for the 2004 Regional Transportation Plan (RTP) and then modified for the Nexus Study based on local jurisdiction input. The list was distributed to local jurisdictions for review and comment. A list of potential railroad grade crossing projects also has been compiled. Only the grade crossings on the Nexus Study Network are included in the analysis.

**Figure 1 (Nexus Network—Valley)**

**Figure 2 (Nexus Network—Victor Valley)**

### **Forecast Growth by Jurisdiction**

The calculation of fair share development contributions required an estimate of projected growth for residential and non-residential development. The data set used as the starting point for projection of residential development (single and multi-family dwelling units) and nonresidential development (retail and non-retail employment) was the 2030 local input provided as part of the growth forecasting process for the 2004 RTP. This iterative process, well-documented in the 2004 RTP of the Southern California Association of Governments (SCAG), generated an initial forecast for the entire Southern California region by jurisdiction, which was then given to local jurisdictions for review, comment, and possible modification. The “local input” 2030 data set was used for the Nexus Study because it was developed through the direct involvement of and review by each of the local jurisdictions. Each local jurisdiction signed off on its local input data in late 2002. These forecasts have been reviewed and updated by local jurisdictions in early and mid-2005. Three specific review and comment periods were provided to local jurisdictions in 2005 for both the growth forecasts and for the project lists. SANBAG staff was also available to meet with local jurisdictions individually and held such meetings with the majority of jurisdictions. The year 2004 was used as the base year for the analysis of growth forecasts. The 2004 dwelling unit totals by jurisdiction are based on California Department of Finance data. The 2004 employment data (retail and non-retail) was derived by adding one year of growth to the 2003 employment data reviewed by each of the local jurisdictions. The growth was estimated as 1/27<sup>th</sup> of the projected growth between 2003 and 2030.

Table 1 presents the 2004 and 2030 estimates of dwelling units and employment by jurisdiction. Table 2 presents the growth estimates for unincorporated areas within each city sphere area. The tables show the projected growth over the entire 26-year period. By way of comparison, an average of approximately 8,000 new residential dwelling units were permitted annually by local jurisdictions in San Bernardino County between 1994 and 2010 (California Department of Finance Table I-6). The range in annual housing permits is large, from a high of approximately 18,000 in 2004 to a low of approximately 2,000 units in 2010. This period included two significant Southern California recessions plus the residential housing boom of the mid-2000s. The projected growth of about 290,000 dwelling units over the 26-year Nexus Study planning period equates to an average annual rate of about 10,700 units. Thus, the rate of growth contained in the projections for the Nexus Study would appear to be slightly higher than the historic rate, but the total growth would be achieved with additional years of growth beyond 2030.

### **Costs of Arterial, Interchange, and Railroad Grade Crossing Improvements**

Cost estimates for many of the proposed improvements were originally obtained through jurisdiction submissions as part of the 2004 Regional Transportation Plan. This served as an initial foundation for the estimates of project cost. In other cases, the list was derived from projects contained in existing local jurisdiction development impact fee (DIF) programs. The initial list of projects and costs was again reviewed by each local jurisdiction in each biennial update of the Nexus Study. Costs were updated generally through application of escalation factors. The 2011 update of the Nexus Study includes a complete re-estimation of project costs. Cost escalation factors will be applied for subsequent biennial updates. The cost estimates were generated as follows:

- **For arterials**, costs were estimated as follows:
  - The local jurisdiction projects and cost estimates were accepted directly and entered into a database. These included only the arterial projects on the Nexus Study Network. Unless otherwise noted, the costs include project development, engineering, right-of-way and construction costs. In some cases, bridges, traffic signals, and other cost items are specified separately. Where these items are not separately identified, the costs are assumed to be included in the overall cost estimate for widening of each facility. The existing number of lanes and the number of lanes after improvement are also identified for projects where the information was available. Local jurisdictions may not include costs of improvements such as sidewalk, curb and gutter and match-up pavement along undeveloped frontages, for which developers would ordinarily be responsible. See Appendix J of the CMP for details on project cost eligibility. The costs included in the Nexus Study were reduced by the amount of federal earmarks for individual arterial projects contained in prior federal legislation or appropriations, where specifically identified, based on the development mitigation principles adopted by the SANBAG Board.
  - The Measure I Strategic Plan identified equitable share percentages for each jurisdiction in the San Bernardino Valley. Equitable shares are defined as the percentage of Measure I Arterial Sub-program funding guaranteed to each Valley jurisdiction over the life of Measure I 2010-2040. The percentage is the ratio of public share costs for each jurisdiction's list of arterial projects to the total Valley arterial public share costs in the Nexus Study as it was approved by the SANBAG Board in November 2007.
  - It should be recognized that the affordability of the arterial program, defined by the project cost estimates compared to the forecast revenue from both the development share and the public share, varies over time. When the Nexus Study was first prepared in 2005, the forecast revenue was approximately equal to the estimated costs. Although costs have decreased during the Great Recession, the estimated costs are higher than those estimated in 2005, and the Measure I revenue forecast has declined. This means that in this 2013 Nexus Study update it is estimated that Measure I revenue can fund only about half of the estimated

public share cost. This does not necessarily mean that jurisdictions should reduce their projects. The estimated Measure I revenue could increase faster than the increase in costs in the future, or additional revenue (state, federal, or local) may be identified to make up part of the public share gap. Alternatively, some of the arterials may not be constructed by 2040 but rather may still be constructed subsequent to the current Measure I using an as-yet unidentified public funding source.

- **For interchanges**, costs were estimated based on the following basic criteria:
  - Used the most recent Project Programming Request (PPR), Regional Transportation Improvement Program (RTIP) data, Project Study Report (PSR), or other updated costs from local jurisdictions. If necessary, these costs were updated to 2013. In some cases, verified cost estimates for one interchange were used to estimate costs for other interchanges where the improvement needs were expected to be similar. The interchange costs were reduced by the amount of federal earmarks, where specifically identified.
  - It should be understood that these planning-level estimates are based on the best available information and represent costs for 2013. SANBAG will actively participate in project development activities for interchanges included in the Nexus Study.
- **For railroad grade crossing projects**, costs were updated based on the most recent project development activities by SANBAG and local jurisdictions. Again, costs were reduced based on federal earmarks, where specifically identified. Costs are consistent with the Trade Corridors Improvement Fund Project Programming Requests (PPRs) submitted to the California Transportation Commission.

The list of railroad grade crossing improvements is presented in a later section. The arterial project list is provided in Attachment 1 of this report. The interchange project list and associated cost estimates are provided in Table 3.

PSR – Project Study Report

PPR – Project Programming Request provided by local jurisdiction or SANBAG

PAA – Project Advancement Agreement

FTIP – Federal Transportation Improvement Program

DIF – Development Impact Fee Program

Ecosys – Estimate incorporated into Ecosys project management tool from SANBAG and local input

No change means no additional information available since 2011 Nexus Study.

### **Methodology for Estimating Proportion of Costs Attributable to New Development**

State law requires that new development not be charged to correct existing transportation deficiencies. An analysis was therefore conducted to estimate the cost of the identified improvements attributable to new development. It is important to note that there are different methodologies that could be used to estimate the proportion of cost attributable to new development. One approach would determine whether new development would require the widening or expansion of an existing facility to meet predetermined performance criteria (e.g. a specified “level of service”). New development could be deemed to be responsible for 100 percent of the cost of improving the facility to a level that would achieve the performance criteria, since that improvement would not be necessary if the development did not occur.

Another approach is to allocate new development’s fair share based on the proportion of total traffic that the new growth represents. This would be calculated as a ratio of the estimated growth in traffic (between existing and future years) to the total traffic in the future year. The second approach is more conservative, as new development is held to be responsible for a share of the cost of facility expansion, not 100 percent of the cost. Even though the SANBAG Nexus Study takes the second approach, local jurisdictions may follow the first approach or any alternate approach that is consistent with California law and that achieves the minimum fair share development contribution levels specified in this Nexus Study. The methodology for arterials, interchanges, and railroad crossings involved the following steps:

#### **Methodology for Arterial Project Fair Share:**

- Calculate trip growth (2004 to 2030) for each jurisdiction, based on growth data. Trips for each jurisdiction were estimated by applying vehicle trip generation rates per dwelling unit (single and multiple family) and per employee (retail and non-retail) to the previously described 2004 and 2030 dwelling unit and employment data. These are actually defined as “trip ends.” The number of trips would be calculated as the number of trip ends divided by two. The trip generation rates are:
  - Single family dwelling unit – 9.57 vehicle trip ends (in and out) per day (based on the Institute of Transportation Engineers report *Trip Generation*)
  - Multi-family dwelling unit – 6.63 vehicle trip ends per day (based on the ITE report *Trip Generation*)
  - Retail – 19.5 vehicle trip ends per employee per day (based on per-employee rates used by SCAG)
  - Non-retail - 1.85 vehicle trip ends per employee per day (based on per-employee rates used by SCAG)
- Calculate total trip ends in passenger car equivalents (PCEs) for each jurisdiction and sphere area.
- Growth’s fair share = ratio of growth in trip ends (2004 to 2030) to total 2030 trip ends. These percentages (for each jurisdiction and sphere) were previously illustrated in the last column of Tables 1 and 2. (Note: for the “Donut Hole” in

unincorporated San Bernardino County, the ratio of trip growth to 2030 trips was based on trips taken from a January 2005 Traffic Impact Analysis entitled “County of San Bernardino Donut Hole Projects Cumulative Traffic Impact Analysis.” The dwelling unit and employment data in the Donut Hole were not adequately up-to-date for calculating this percentage.)

- Multiply fair share by Nexus Study Network arterial improvement cost for each jurisdiction

There is no allocation of arterial project costs to jurisdictions outside the jurisdiction in which the project is located. Each jurisdiction is responsible for the arterial improvements within its own jurisdiction.

**Methodology for Interchange Project Fair Share:**

- Define “traffic sheds” for each interchange. A traffic shed represents the geographic area around the interchange from which most of the traffic using that interchange is likely to be drawn. In general, traffic will be drawn to an interchange following the roadways that cross the freeway. However, it is not expected that traffic within each traffic shed will exclusively use the interchange with which the traffic shed is associated. Where an arterial crosses the freeway at a perpendicular angle, the traffic shed was extended half way to the adjacent interchanges. Different configurations were required for traffic sheds in which the arterial was not perpendicular to the freeway. Further, the traffic sheds were generally extended laterally (i.e. perpendicular to the freeway) no farther than half way to the next parallel freeway. Traffic sheds used in the analysis are shown in Figures 3 and 4 for the Valley and Victor Valley, respectively. Several “select link” runs were conducted using the RIVSAN CTP model to verify the logic behind the definition of the traffic sheds. The traffic shed approach was accepted by the Nexus Study Task Force and CTP TAC through reviews of the methodology in 2004.
- Calculate the projected growth in trips (2004 to 2030) by jurisdiction within the traffic shed for each interchange. This analysis was conducted using SANBAG’s GIS system, overlaying the traffic sheds on the traffic analysis zones (TAZs) containing the socio-economic data. Trip generation rates used in this analysis are discussed in a subsequent section.
- The fair share attributed to new development = ratio of traffic growth (2030 minus 2004) to total 2030 traffic. It should be noted that this approach will provide a conservatively low estimate of the fair share attributable to growth, compared to the alternate approach discussed earlier for arterials (i.e. assign 100 percent of the cost of the improvement to new development, if it were determined that the improvement would not be needed if no more growth were to occur). For new interchanges, a minimum fair share percentage of 50 percent was applied.
- Allocate the fair share cost among jurisdictions based on the calculations of trip growth within the traffic shed, by jurisdiction. For unincorporated areas, the fair share cost was estimated for each city sphere area.
- Multiply fair share by interchange improvement cost.

- Calculate jurisdiction-level total fair share interchange costs. Table 4 shows the calculations of percent responsibility by jurisdiction and jurisdiction sphere area. Table 5 shows the fair share dollar allocation for jurisdictions and spheres. For example, the fair share allocation of interchange cost could be allocated as follows:
  - Interchange cost = \$20 million
  - Ratio of growth (2030 trips within the traffic shed minus 2004 trips) to 2030 trips = 25%
  - Fair share cost = \$5 million (\$20 million X 25%)
  - 80% of “traffic shed” trips from Jurisdiction X = \$4 million
  - 20% of trips from Jurisdiction Y = \$1 million

**Methodology for Railroad Grade Crossing Project Fair Share:**

- The ratio of trip growth to 2030 trips by jurisdiction (same as for the arterial analysis) was applied to the railroad grade crossing project cost
- An assessment was made of the proportion of the growth in traffic delays attributable to train growth versus traffic growth. The fair share allocated to new development was reduced by the percentage of train growth. Growth in train volume was based on forecasts prepared for the Inland Empire Rail Mainline Study by Robert Leachman & Associates. Fair share costs are not assessed to new development for the proportion attributable to train growth.
- Only costs for railroad crossing projects on the Nexus Study network were included in the fair share calculation. Individual jurisdictions may include other projects in their own DIF programs. Table 6 lists the railroad grade separation projects on the Nexus Study Network, their costs, ratio of train growth to 2030 train volume, ratio of traffic growth to 2030 traffic volume (at a jurisdictional level), and fair share cost for the railroad grade crossing projects.

**Estimated Development Contribution Levels by Jurisdiction and Sphere Area**

Table 7 summarizes the jurisdiction-by-jurisdiction costs and fair share amounts for regional arterials, interchanges, and railroad grade crossing projects. Table 8 provides the equitable share information by jurisdiction for the Valley subarea. Table 9 breaks down the fair share amounts by sphere of influence or County subarea. Provisions for the on-going maintenance and implementation of local jurisdiction development mitigation programs are contained in Appendix J of the CMP.

Several special circumstances need to be noted. First, Ontario International Airport, which is expected to undergo a major expansion through year 2030, will develop its own mitigation program in conjunction with the City of Ontario. Los Angeles World Airports (LAWA) will prepare an Environmental Impact Report and associated Traffic Impact Analysis report for its updated master plan. That TIA, to be prepared in accordance with CMP guidelines, will provide the basis for mitigation of traffic impacts in the vicinity of the airport. This will result in an agreement between the City of Ontario and LAWA governing the transportation improvements that will be funded as part of the airport expansion. These commitments may be considered a part of the City of Ontario's development mitigation program, subject to the provisions of Chapter 4 and Appendix J of the CMP. Transportation impact mitigation committed to outside the City of Ontario may be considered part of the development mitigation program for the appropriate jurisdiction. Mitigation for San Bernardino International Airport/IVDA and for Southern California Logistics Airport may be handled in the same way.

**Update of Local Jurisdiction Fee Programs**

Local jurisdiction development mitigation programs must be updated annually to incorporate project cost escalation. The city council/Board of Supervisors must approve the adjustments on an annual basis and reflect those adjustments in local development impact fees or other per-unit mitigation levels or assessments. The adjustments shall be based on an escalation factor approved by the SANBAG Board of Directors or by an alternative cost escalation methodology approved by SANBAG during the biennial update to the Nexus Study.

Local jurisdictions must annually adopt adjustments to their development mitigation programs to reflect the SANBAG Board adopted changes to the Nexus Study. The adjustment must be approved by the city council/Board of Supervisors by resolution on or before either January 1 or July 1, depending on the timeline chosen by the local jurisdiction. Included below is the list of local jurisdiction development mitigation program update timelines as submitted to SANBAG during the 2007 Nexus Study update.

**Table 9. Local Jurisdiction Development Mitigation Program Update Schedule**

Jurisdiction	July 1	January 1
Adelanto*	X	
Apple Valley		X
Chino		X
Chino Hills		X
Colton	X	
Fontana		X
Grand Terrace		X
Hesperia		X
Highland		X
Loma Linda		X
Montclair	X
